

ABSTRACT OF THE DISCLOSURE

A photographing system in which a camera and a flash device cooperate to perform flash photographing and a photographic information transmission system in which a second hand-held terminal such as a flash device is controlled based on a signal relating to 5 photographing that is transmitted from a first hand-held terminal such as a camera to the second hand-held terminal. A unique identification code for identification of the first hand-held terminal or the second hand-held terminal is provided in at least one of the first hand-held terminal and the second hand-held terminal. The second hand-held terminal has a collating program for collating a unique identification code that is transmitted from the first hand-held 10 terminal by using radio waves as a medium with a unique identification code provided in the second hand-held terminal.
